

Introduction

The student office Hego Berria organizes events every year to strengthen ties within the IT department. One of these events is the sponsorship between 1st year students and 2nd year students.

Problem

The student office Hego Berria needs to automate this sponsorship system because manually associating students takes a lot of time.

Consequences

Time spent

Matching more than 120 students takes a lot of time.

Integration of the environment

Hego Berria is creating an application environment, with a showcase or carpooling website.

Third-party applications

Third-party applications such as Google Forms denature the spirit of the student office.

Solution

We will developp a web application
that allow the student office to make
the sponsorship automatically.

Key-Features

User friendly interface

The UI/UX has been designed to be as simple as possible to make users want to use our application.

Secured environment

All the personnal data is secured to avoid any security vulnerabilities.

Account-based

Users must use their university email, providing them the same access all along their cursus within the structure.

The student office

Creates the questionnaire

Second year students

Can give of help or any kind of advices

First year students

Can ask their mentor for help

How it works

Anyone connecting to the site can see whether the questionnaire is available or not and can modify their personal information. We then have their surname, first name, student email address and the answers they will give to the questionnaire (only for the duration of the event).

Team members

Computer Science students in Anglet
